

Define a *word* as a sequence of consecutive English letters. Find the longest *word* from the given string.

Example

For `text = "Ready, steady, go!"`, the output should be

`longestWord(text) = "steady"`.

Input/Output

- **[execution time limit] 4 seconds (py)**
-
- **[input] string text**
- *Guaranteed constraints:*
- $4 \leq \text{text.length} \leq 50$.
-
- **[output] string**
- The longest *word* from `text`. It's guaranteed that there is a unique output.
